Flare Therapeutics is looking for an **Associate/Senior Associate Scientist, Biology**

To date, the collective research on transcription factors has been elusive to drug discovery. Flare Therapeutics, an early-stage biotech, has now reached a moment of light - with the prospect of forever changing the trajectory of how we treat disease. We are trailblazing the path to transcription factors by intervening at a previously hidden region we have identified as the 'switch site.' Join us and help illuminate the path to the possible.

**In this role you will...**

- Contribute to the strategy, experimental design and execution of efforts to understand the effects of perturbation of transcription factors and to validate novel targets for further drug discovery investigation
- Collaborate with chemistry and biochemistry colleagues to drive mechanistic understanding of small molecule modulators of transcription factors to improve compound efficacy for H2L and LO advancement
- Interpret your data and regularly present to the scientific and management teams to inform data-driven decisions on future strategy

**About you...**

- You have a BS or a MS in molecular or cellular biology, or related field
- You have 3+ years of related experience and a Strong track record of productivity and ability to drive scientific projects at the bench
- You may have experience in oncology and/or transcriptional regulation
- You would consider yourself skilled in cutting edge molecular and cellular biology techniques
- You may also have experience in omics data mining and analysis
- You consider yourself to be a self-starter with great ability to prioritize and balance multiple tasks, meet multiple deadlines, and thrive in a dynamically changing and fast-paced environment
- You have strong communication skills, both written and verbal, including strong presentation skills
- You have a strong passion for science and are driven by making a meaningful contribution for patients
